This package provides Windows.inf files that create MFX and DX plugins for your Windows Explorer shell. The plugins provide an interface to the mfx.dll DLL library and allow you to connect to the mfx.dll DLL for DX plugins and act as a proxy to a DX plugin that would normally be called directly from a mfx.dll DLL (such as bmp2cam.dll). The Windows Shell Extensions package is provided for both 32-bit and 64-bit Windows 7 and Windows Server 2008 R2. The Windows Shell Extensions package is provided as-is, and should be used only for evaluation purposes. It is provided for documentation purposes and for reference only. This package is not supported by Microsoft. Any problems, questions, or issues pertaining to this package should be directed to the software vendor.

MFX Plugin Design: The Windows Shell Extensions package defines two MFX plugin types: bmp2cam.inf and bmp2ps.inf. The bmp2cam.inf plugin creates a basic MFX plugin to access bmp2cam.dll. This plugin type is provided as a basis of creating additional MFX plugins that can access bmp2cam.dll, DLLs that are managed by Microsoft MFX and DX, and other DLLs that are managed by MFX or DX. The bmp2cam.inf plugin provides interface functionality to the MFX or DX plugin that is called by bmp2cam.dll. This plugin type does not provide any configuration functionality to the MFX or DX plugins that it calls. The bmp2cam.inf plugin is provided as a template to create MFX plugins that call bmp2cam.dll and are managed by MFX or DX. For information about how to create MFX plugins, see "How to Create MFX Plugins." The bmp2ps.inf plugin creates a basic MFX plugin to access bmp2ps.dll. This plugin type is provided as a basis of creating additional MFX plugins that can access bmp2ps.dll, DLLs that are managed by MFX and DX, and other DLLs that are managed by MFX or DX. The bmp2ps.inf plugin provides interface functionality to the MFX or DX plugin that is called by bmp2ps.dll. This plugin type does not provide any configuration functionality to the MFX or DX plugins that it calls. The bmp2ps.

What's New In Windows Shell Extensions?

The MFX plugin, added to the Windows Shell Extensions, enables you to assign keys for MXO-based software such as Adobe® Creative Suite® 5 and Adobe® Photoshop® CS2 to navigate your MFX files directly in the Windows Explorer. Background: Adobe® Creative Suite® 5 and Adobe® Photoshop® CS2 are MFX-based applications. Once the MFX plugin is installed into Windows Explorer, you can easily access MFX files as you would expect them to be; open, open with, save and so on. The process is analogous to MFI. This adds to the power of the MXO functionality within Adobe® Creative Suite® 5 and Adobe® Photoshop® CS2. Microsoft Corp. United States v. Microsoft Corp., 2001 WL 764730 (D.C. Cir. July 10, 2001) was a court case in which the U.S. District Court for the Western District of Washington, following a summary judgement motion, granted summary judgement to the United States that Microsoft breached United States copyright law by effectively bypassing the Open Authentication standard when creating the Windows operating system. In his ruling, Judge Thomas Zilly stated that the Open Authentication standard was not copyrightable because it was a standardization of software protocols, and not a "purely factual or utilitarian work" as required under United States copyright law. As a result of the ruling, the United States was granted

summary judgement on the case of damages that followed. Microsoft lost at this ruling, but in subsequent rulings had its rights partially restored. Background The Open Authentication standard was originally developed and implemented by the RFID industry in the late 1990s. The goal of the standard was to standardize the software protocols used by companies producing portable software tokens, including systems such as the EPC, ISO/IEC 14443, and various systems based on the Zebra ACR122. Microsoft initially announced its support of the Open Authentication standard in a press release published on April 29, 1998. After that, Microsoft began to implement the standard on its Windows 98SE, Windows NT 4.0, and Windows 2000 operating systems. However, in 2001, Microsoft issued a patch that fixed a security vulnerability in the operating system, which implemented "raw access," or non-standardized authentication, through a patch to the Winlogon system, which bypassed the standard.
